a modified polylinker; Site 1: Not 1; Site 2: ECC RI;
Plasmid DNA from the normalized library NCI CGAP Kid3 was
prepared, and so circles were made in vitro. PolTowing HAP
purification, this DNA was used as tracer in a subtractive
hybridization. Tacation. The driver was PCR-amplified cDNAs
from a pool of 5,000 clones made from the same library
(clone1Ds 1322376-1323911, 1456007-1456775, and
1500552-150285). Subtraction by Bento Soares and M.
Patima Bonaldo. "

/note="Organ: pooled: Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site 1: Not 1; Site 2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbH119W, testis NHT, and B-call NCI_CGAP_GCBI) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302097, 682632-687239, 726408-728711, and 729096-731339. Subtraction by Bento Soares and M. Fatima Bonaldo. "

Clones are derived from the chimpanzee BAC library RPCI-43 This BAC end was generated during the R&D process and may have higher chance of clone tracking errors.
/tissue_type="from acute myelogenous leukemia"
/lab_host="DH10B (T1 phage-resistant)"
/clone lib="NTH MGC 55"
/note="Organ: bone marrow, Vector: pDNR-LIB (Clontech);
Site_1: Sfil (ggogectoggec); Site_2: Sfil
(ggocattateggcc); Double-stranded cDNA was prepared from cell line RNA. 5' and 3' adaptors were used in cloning as follows: 5' adaptor sequence: 5'-CACGCCATATGGCC-3' and 3' adaptor sequence: 5'-CACGCCATATGGCC-3' and 5'-ATTCTACAGGCCGACGACGACGAGGGCGACATG-dT(3)BN-3' (where B = A, C, or G and N = A, C, G, or T). Average insert size 1.65 kb (range 0.9-4.0 kb). 14/15 colonies contained inserts by PCR. This library was enriched for full-length clones and was constructed by Clontech Laboratories (Palo, Alto, CA)."

Original lib:1st strand of cDNA was synthesized with reverse
transcriptase and oligo(dT) beads, then cDNA was amplified by PCR
using modified SWART primers. The final cDNA was cloned in pAMP1
vector in annealing reaction with Uracil DNA Glycosylase (UDG).
Normalized by generating biotin labeled linear PCR using original
lib cut with Sal I as template, followed with Sau3A digest, and
hybridizing with ssDNA from original lib. RNA provided by Jeff
Gordon lab and library construction by Rose Tidwell and Mike
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /mol_type="maxwa"

Lablee09.V1 Normalized Small intestinal epithelia progenitors Mus musculus CDNA 5', mRNA sequence.

CD645057
Washington University School of Medicine list strand of CDNA was synthesized with reverse transcriptase a clist strand of CDNA was synthesized with reverse transcriptase aclise (21) beads, then cDNA was amplified by PCR using modified SMART primers. The final cDNA was cloned in pAMP1 vector in annealing reaction with Uracil DNA Glycosylase (UDG). Library constructed by Y. Korshunova and M. Lovett. Library materials provided by J. Gordon lab.
Putative full length read vector length is Seq primer: -40RP from Gibco.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The final cDNA was cloned in pAMP1 vector in annealing reaction with Uracil DNA Glycosylase (UDG). Normalized by currenting biotin labeled linear PCR using original lib cut with Sal I as template, followed with Sau3A digest, and hybridizing with ssDNA from original lib. RNA provided by Jeff Gordon lab and library construction by Rose

Its strand of CDNA was synthesized with reverse transcriptase and
oliso (dr) beads, then CDNA was amplified by PCR using modified
SWART primers. The final CDNA was cloned in pAMP1 vector in
annealing reaction with Uracil DNA Glycosylase (UDG). Library
constructed by R. Tidwell Y. Stappenbeck and J.I. Gordon. Library
re-arrayed by R. Tidwell.

Ist Etrand of Canda was amplified by PCR using modified oligo (dT) beads, then CDNA was amplified by PCR using modified sonstructed by Y. Korshunova and M. Lovett. Library materials provided by J. Gordon lab.

Putative full length as ambound M. Lovett. Library materials between to vector length is Seq primer: -40RP from Gibco.

Seq primer: -40RP from Gibco.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /organism="Mus musculus"

Increa" Vector: pAMP1; 1st strand of cDNA was synthesized with reverse transcriptase and oligo(dT) beads, then CDNA was amplified by PCR using modified SMAT primers. The final cDNA was cloned in pAMP1 vector in annealing reaction with Uracil DNA Glycosylase (UDG). Library materials provided by T.S. Stappenbeck and J.I. Gordon. Library constructed by R. Tidwell Y.Korshunova, M. Lovett. Library was re-arrayed by R. Tidwell."

Ist Etrand of ColDA was synthesized with reverse transcriptase and oligo(dT) beads, then cDNA was cloned in pAMP1 vector in annealing reaction with Uracil DNA Glycosylase (UDG). Library constructed by Y. Korshunova and M. Lovett. Library materials provided by J. Gordon lab.

Phtative full length is Seq primer: -40RP from Gibco.

SMART primers on the final color was amplified by PCR using modified
SMART primers. The final color was amplified by PCR using modified
SMART primers. The final color was amplified by PCR using modified
SMART primers. The final color was a manaling reaction with Uracil DNA Glycosylase (UDG). Library
constructed by Y. Korshunova and M. Lovett. Library materials
provided by J. Gordon lab.
Putative full length read
vector to vector length is
Seq primer: 40RP from Gibco
High quality sequence stop: 249.
High quality sequence stop: 249.
                               No si sequence available.

This clone (DKEZp4341035) is available at the RZPD in Berlin.

Strand of DNA was synthesized with reverse transcriptase and
oligo(dT) beads, then CDNA was amplified by PCR using modified
SMART primers. The final cDNA was cloned in pAMP1 vector in
annealing reaction with Uracil DNA Glycosylase (UDG). Library
constructed by Y. Korshunova and M. Lovett. Library materials

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Washington University School of Medicine
Washington University School of Medicine
Ist strand of CDNA was synthesized with reverse transcriptase a
oligo(dT) beads, then cDNA was amplified by PCR using modified
SMART primers. The final cDNA was cloned in pAMP1 vector in
annealing reaction with Uracil DNA Glycosylase (UDG). Library
constructed by Y. Korshunova and M. Lovett. Library materials
provided by Mills JC & Gordon JI.
Putative full length read

/note="Vector: pBluescript II XR, Site 1: EcoRI; Site 2: XhoI; This CDNA library was constructed from mRNA isolated from mmature flowers of field grown plants. The CDNA library was prepared using the Stratagene pBluescript II XR library construction Kit. Complementary DNA was synthesized from mRNA using a primer consisting of a poly (dT) sequence with ANOI restriction site. EcoRI adapters were ligated to the blunt-ended CDNA fragments followed by XhoI adgestion. The CDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated CDNA fragments were transformed into XLIO-Gold host cells. This library was constructed by Dr. Randy Shoemaker and Dr. John Erpelding."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Eukaryota; Metazoa; Chordata; Sciurognathi; Muridae; Murinae; Musmalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus. 1 (bases 1 to 2 5).

/clone_lb=Colon epithelia progenitors cDNA was synthesized
/note="Wector: pAMP1; 1st strand of cDNA was synthesized
was amplified by PCR using modified SWART primers. The
final cDNA was cloned in pAMP1 vector in annealing
reaction with Uracii DNA Glycosylase (UDG). Library
constructed by Y. Korshunova and M. Lovett. Library
materials provided by J. Gordon lab."

Ist strand of conk, was synthesized with reverse transcriptase and oligo (dT) beads, then CDNA was amplified by PCR using modified SNART primers. The final CDNA was aloned in pAMPI vector in annealing reaction with Uracil DNA was cloned in pAMPI vector in annealing reaction with Uracil DNA was closed in pampi provided by V. Korshunova and M. Lovett. Library materials

Xhol; Library was constructed by Debopam Chakrabarti.
Xhol; Library was constructed by Debopam Chakrabarti.
Total RNA samples were isolated from mixed stage
saponin(0.18'-1ysed P. falciparum 3D7 infected
erythrocytes by the acidic quanidinium-phenol chloroform
method. The poly A+ RNA was isolated by the polyAT-Tract
mRNA isolation system (Fromega, WI) using streptavidin
Magnesphere particles. Directional cDNA libraries were
constructed by oligo d(T) priming of poly(A)+ RNA (Smg)
into EcoRI and Xhol sites of 1 ZaplI vector using the Zap
cDNA synthesis kit (Stragene, CA). The average size of the
cDNA inserts in the library was between 1.0 and 1.5kb.
Clones were mass excised using the ExAssist helper phage
(Stratagene), the phagemids were precitptated with PBG
8000 and extracted with phenol/chloroform. Phagemid DNA
was electroporated into DH10B cells."

Cloned unidirectionally. Poly (A) + RNA was concentrated and purified using with oligo(GT) with Xho! Site (primer Coloned unidirectionally. Poly (A) + RNA was concentrated and primed with oligo(GT) with Xho! Site (primer CDSIII/3-xho!) and 5' SWART anchor added using chimeric DNA-RNA oligo (SWART-Noti-r-GGG). SMART-Noti-r-GGG was used in case a pcR using 1st strand and primers specific to SL1 leader sequence (SL1-Not!) and 5' SWART anchor added using chemically competent using lst strand and primer specific to SL1 leader sequence (SL1-Not!) fractionated on Chroma-spin 400 columns (Clontech) and ligated to digested pGEM -11zf(+) plasmid. Chemically competent cells were used as host. This library was digested by David Bird but deaved be bott. Then library was digested by David Bird but deaved by David bird but deaved by David Bird, Putative full length read
The vector to vector length is 396

concentrated and purified using Dynabeads (Dynal) and mRNA eluted for 1ST strand synthesis. 1st strand cDNA created using wmLV RT(PowerScript, Clontech) and primed with oligo (dT) with XhoI site (primer CDSIII/3-XhoI) and 5' SWART anchor added using chimeric DNA-RNA oligo (SWART anchor added using chimeric DNA-RNA oligo (SWART-NotIr-GGG). SWART-NotIr-GGG was used in case a PCR using the SWART template was also desired. 15 PCR cycles were done using 1st strand and primers specific to SLI leader sequence (SLI-NotI) and 3' end (XhoI-No-dT). dscDNA was digested using XhoII/NotI, fractionated on Chroma-spin 400 columns (Clontech) and ligated to digested pGBM -11zf(+) plasmid. Chemically competent cells were used as host. This library was provided by David Bird's lab (david bird@ncsu.edu), of North Carolina State
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /clone lib="NCI_CGAP_Thyl"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
using the SMART template was also desired. 15 PCR cycles were done using 1st strand and primers specific to SLA leader sequence (SLI-Norl) and 3' end (Xho-No-AT). dscDNA was disgested using XhoI/NotI, fractionated on Chroma-spin 400 columns (Clontech) and ligated to digested pGEM -11zf(+) plasmid. Chemically competent cells were used as host. This library was provided by David Bird's lab (david bird@ncsu.edu), of North Carolina State University. Seq primer: Sp6 High quality sequence stop: 441.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New Mexico State University

/notes "Vector: Lambda Triplex2; Site 1: SfiIA, Site 2: SfiIB; Spores were germinated in the presence of 1% CO2. At 10 days, tissue was ground in liquid nitrogen with sand and mRNA isolated with a modified hot phenol/SbS method. The SWART-PCR method (Clontech) was used for cDNA synthesis from 1 ug of total RNA followed by directional cloning in Sfil digested Triplex2 vector. Plasmid subclones in priplex were recovered by cre-lox excision in B. coli strain BM25.8 and sequenced from the 5' end with the 5'Triplex sequencing primer (Tpx) and the 3' end with the T7 primer (T7). (Sfil by in Comment line of EST file is estimated insert size)"
